Bachillerato Técnico Vocacional en Desarrollo de Software

Module 3.6 — English for IT Systems

SPRINT 0

PROJECT CHARTER

Activity 04 — Build It in English · Day 1
Acta de arranque del proyecto — Actividad 04 · Día 1

Field	Value
Student(s) / Estudiante(s)	Cristian Antonio Castro Quiroa, Jose Daniel Aguiluz Valladarez, Estiven Ariel Platero García, Moises Isaí Cornelio Hernandez
Grade and section / Grado y sección	3DSA
Project / Proyecto	Field Kit — Technician Service Log
Environment / Entorno	C# · .NET MAUI (adapted from the original Python · Flet specification)
IDE and version	Visual Studio Community 2026 · .NET 10
Date / Fecha	01/09/2026
Teacher / Docente	Ing. Javier Arturo García Mineros

Cantón Lourdes, Colón, La Libertad, El Salvador

Team members / Integrantes

No.	Full name / Nombre completo
16	Jose Daniel Aguiluz Valladarez
23	Cristian Antonio Castro Quiroa
24	Moises Isaí Cornelio Hernandez
31	Estiven Ariel Platero García

1. Purpose of the application

Field Kit is the mobile companion of the maintenance technician the team simulated in Activity 03: it lets a technician register a client visit, add and check off the tasks performed during that visit, and automatically produce a plain-text service summary ready to send to the client. The team chose to build it in .NET MAUI instead of the originally specified Flet, so that a single C# codebase runs on both Windows and Android, consistent with the cross-platform approach studied in Block 3. It runs on a phone-sized layout, keeps every visit in memory during the session, and is built entirely in English, from class names to on-screen messages.

Field Kit es el complemento móvil del técnico de mantenimiento que el equipo simuló en la Actividad 03: permite registrar la visita de un cliente, agregar y marcar las tareas realizadas durante esa visita, y generar automáticamente un resumen de servicio en texto plano listo para enviar al cliente. El equipo decidió construirlo en .NET MAUI en lugar del Flet originalmente especificado, para que un solo código en C# corra en Windows y Android, siguiendo el enfoque multiplataforma estudiado en el Bloque 3. Funciona en una vista de tamaño de teléfono, mantiene cada visita en memoria durante la sesión, y está construido completamente en inglés, desde los nombres de clases hasta los mensajes en pantalla.

2. User stories

#	As a ... I want ... so that ...	Acceptance criteria
1	As a technician, I want to create a new visit with the client's name and date, so that I can start recording the work I do at each stop.	The visit is added to the visit list immediately. The client name field cannot be empty. The visit starts with status "Open".
2	As a technician, I want to add tasks to an open visit, so that I can list every action I perform during the service.	Each task has a description and an estimated time in minutes. A task cannot be added with an empty description. The task appears immediately under the visit.
3	As a technician, I want to mark a task as done, so that the visit reflects what has actually been completed.	Tapping the checkbox toggles the task between done and pending. The visit's total time recalculates immediately after any change. A done task can be marked pending again.
4	As a technician, I want the visit's status to update automatically, so that I do not have to set it manually.	A visit with no tasks marked done is "Open". A visit with some but not all tasks done is "In progress". A visit with all tasks done is "Closed".
5	As a technician, I want to generate a plain-text service summary in English, so that I can send it to the client without retyping anything.	The summary lists the client name, date, every task and its status. The summary shows the total time in minutes. The summary text is generated on demand from a button.
6	As a technician, I want the app's layout to adapt to a phone screen, so that I can use it comfortably in the field.	All buttons remain reachable with one hand on a typical phone width. Text does not overflow the screen. The visit list scrolls independently from the task checklist.

3. Screens and controls

Screen or view	Controls (named in English)	What the user does there
Visit list	CollectionView cvVisits · Button btnAddVisit · Entry txtSearchClient	Browses all visits, taps one to open it, searches by client name.
New visit form	Entry txtClientName · DatePicker dtpVisitDate · Button btnSaveVisit · Button btnCancelVisit	Fills in the client and date, saves or discards the new visit.
Task checklist	Entry txtTaskDescription · Entry txtTaskMinutes · Button btnAddTask · CheckBox chkTaskDone (one per task) · Label lblStatus · Label lblTotalTime	Adds tasks to the open visit, checks them off, watches the status and total time update.
Summary view	Label lblSummaryOutput · Button btnGenerateSummary · Button btnShareSummary	Generates and reads the plain-text summary, shares it to send to the client.

4. Data model

Class	Fields and types	Where the data lives
Visit	Id (int), ClientName (string), Date (DateTime), Status (string), Tasks (List<ServiceTask>)	In memory (ObservableCollection<Visit>); optionally persisted to visits.json
ServiceTask	Description (string), IsDone (bool), Minutes (int)	In memory, nested inside its parent Visit

5. Setup log

Step	Command or action	Result	Problem found and how you solved it
Install / verify SDK	dotnet --version · dotnet workload install maui	.NET 10 SDK confirmed; MAUI workload installed successfully	The first workload install failed for lack of disk space; freed 4 GB and reran the command
Create project	dotnet new maui -o FieldKit	Project folder FieldKit created with the default MAUI structure	None
First run	dotnet build -t:Run -f net10.0-windows10.0.19041.0	Empty MAUI window opens on Windows without errors	The first run targeted the Android framework by default and failed with no emulator configured; fixed by specifying the Windows target framework explicitly
Folder structure	Created /Models, /Views, /Services in English	Folders created and referenced with the project's default namespace	None

6. Risks

The main risk is losing time on the environment change itself: moving from the specified Flet to .NET MAUI means redoing the setup steps from Block 3 instead of following the Flet instructions from Block 2, so the team scheduled extra setup time today specifically for the MAUI workload installation, which can be slow on a shared lab connection. A second risk is testing on an actual Android device or emulator, since MAUI's Android build step is heavier than its Windows build; the team will develop and verify every MUST feature on Windows first and attempt the Android build only once the Windows version is complete. A third risk is keeping every identifier in English under time pressure; the team will review file by file before submission using the naming table from Block 1.

El riesgo principal es perder tiempo por el cambio de entorno en sí: pasar del Flet especificado a .NET MAUI significa repetir los pasos de configuración del Bloque 3 en lugar de seguir las instrucciones de Flet del Bloque 2, por lo que el equipo destinó tiempo extra de configuración hoy específicamente para la instalación de la carga de trabajo de MAUI, que puede ser lenta en una conexión de laboratorio compartida. Un segundo riesgo es probar en un dispositivo o emulador Android real, ya que el paso de compilación Android de MAUI es más pesado que el de Windows; el equipo desarrollará y verificará cada función MUST primero en Windows e intentará la compilación Android solo cuando la versión de Windows esté completa. Un tercer riesgo es mantener todos los identificadores en inglés bajo presión de tiempo; el equipo revisará archivo por archivo antes de entregar, usando la tabla de nomenclatura del Bloque 1.
